

[Method for displaying application programs of a computer system on a screen]

Abstract of Disclosure

A method of displaying multiple application programs simultaneously is performed in a computer system. The computer system has a main application program and an auxiliary application program. The computer system displays the auxiliary application program on a screen. Upon triggering of a predetermined key, the computer system moves the auxiliary application program down, and displays both the auxiliary application program and the main application program. Upon clicking on an image of the main application program, an image of the auxiliary application program is removed, leaving only the main application program displayed on the screen.
